  Abstract (Basic): EP 160390
           Embryogenic callus and embryogenic cell suspns. of corn inbred B73
      and their clones are new.
           Corn plants and their seed regenerated from embryogenic callus and
      embryogenic cell suspn. of corn inbred B73 and their clones are new.
           The corresp. mutagenised callus and cells suspns., and plants and
           Progeny of corn plants regenerated from embryogenic callus and
      seeds are new.
      embryogenic cells suspns. of corn inbred B73 and their clones. the
      progeny including mutants and variant progeny, are new.
           USE/ADVANTAGE - Whole plants can be regenerated from the
      embryogenic tissue and cell suspn. cultures of corn inbred B73 so that
      in vitro selections for desirable traits or against undesirable traits
      can be made. The cultures may be exposed to herbicides or pathotoxins
      for selection of resistant tissues and cells, and for regeneration of
      resistant plants. In this way improved corn crops can be obtd. @(26pp
